                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           01-APR-1993, integrated into UniProtKB/Swiss-Prot.
01-APR-1993, sequence version 1.
07-MAR-2006, entry version 43.
Genome polyprotein [Contains: Envelope protein M (Matrix protein);
Major envelope protein E; Nonstructural protein I (NS1)] (Fragment).
Dengue virus type 2 (strain TH-36).
Viruses; ssRNA positive-strand viruses, no DNA stage; Flaviviridae;
Flavivirus, 10-ngue virus group.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          EMBL, D10514; BAA01389.1; -; Genomic_RNA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a novel recombinant or synthetic polypeptide comprising an amino acid sequence that has at least about 90% sequence identity to any of the 20 fully defined amino acid sequences given in the specification. The polypeptide of the invention demonstrates virucide activity and may be useful for inducing an immune response to Plaviviruses (arboviruses group B), including Dengue viruses, as well as in detecting and/or diagnosing the presence of antibodies against the Dengue virus serotypes in a sample and for gene therapy. The current sequence is that of a Dengue virus type 4 (DEN-4) C15/truncated prM antigen fusion protein of the invention which comprises the C-terminal 15 amino acids of the capsid protein fused to a truncated form of the prM protein lacking the C-terminal 15 amino acids.

The invention relates to a novel recombinant or synthetic polypeptide comprising an amino acid sequence that has at least about 90% sequence identity to any of the 20 fully defined amino acid sequences given in the specification. The polypeptide of the invention demonstrates virucide activity and may be useful for inducing an immune response to Flaviviruses (arboviruses group B), including Dengue viruses, as well as in detecting and/or diagnosing the presence of antibodies against the Dengue virus serotypes in a sample and for gene therapy. The current sequence is that of a Dengue virus C15/truncated prw antigen fusion protein of the invention which comprises the C-terminal 15 amino acids of the capsid protein fused to a truncated form of the prW protein lacking the C-terminal 15 amino acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New recombinant or synthetic polypeptides and polynucleotides useful for diagnosing, preventing or treating diseases associated with flaviviruses, including dengue viruses.

ო

```
The invention relates to a novel recombinant or synthetic polypeptide comprising an amino acid sequence that has at least about 90% sequence identity to any of the 20 fully defined amino acid sequences given in the specification. The polypeptide of the invention demonstrates virucide activity and may be useful for inducing an immune response to Plaviviruses (arboviruses group B), including Dengue viruses, as well as in detecting and/or diagnosing the presence of antibodies against the Dengue virus serotypes in a sample and for gene therapy. The current sequence is that of the Dengue virus type 1 (DEN-4)/unidentified Dengue virus C15/pm/E partially human codon-optimised antigen fusion protein of the invention which comprises 15 amino acids of the DEN-4 capsid (C) protein fused to the full-length DEN-4 codon-optimised/unidentified Dengue Dengue virus prw protein and DEN-4 codon-optimised/unidentified Dengue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New recombinant or synthetic polypeptides and polynucleotides useful for diagnosing, preventing or treating diseases associated with flaviviruses, including dengue viruses.
                                                                 New recombinant or synthetic polypeptides and polynucleotides useful for diagnosing, preventing or treating diseases associated with flaviviruses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                DEN-4/Dengue virus C15/prM/E part codon-opt antigen fusion protein 2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      virucide; Flavivirus; arboviruses group B; gene therapy; DEN-4; CIS/prM/E; human codon-optimised; prM; envelope; capsid.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This protein represents a fusion protein comprising 2 M protein epitopes from Dengue virus type 2 and type 4 inserted into the P64K protein from Neisseria meningitidis. Synthetic peptides based on the Dengue virus epitope sequences (AAM75408-W15408) and fusion proteins can be used to raise antibodies. The peptides, protein and antibodies are all useful for diagnosis and treatment of Flavivirus infection, e.g. in vaccines. (Updated on 25-MAR-2003 to correct PI field.) (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                  Vazquez Ramudo S, Guzman Tirado G, Guillen Nieto GE, Pardo Lazo OL, Chinea Santiago G, Perez Diaz AB, Pupo Antunez M, Rodriguez Roche R; Reyes Acosta O, Garay Perez HE, Padron Palomares G, Alvarez Vera M; Morier Diaz L, Perez Insuita O, Pelegrino Martinez De La Coterri Pedro,
                                                                                                                                                                                                                                                                                                                                                                                   New peptide(s) and fusion proteins useful for diagnosis and treatment of flavivirus infection - contain cross-reactive epitopes from Dengue virus pre-M/M protein and can induce neutralising antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            DEN-4/Dengue virus C15/prM/E part codon-opt antigen fusion protein 1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     virucide; Flavivirus; arboviruses group B; gene therapy; DEN-4; C15/prM/E; human codon-optimised; prM; envelope; capsid.

The polypeptide of the invention demonstrates virucide activity and may be useful for inducing an immune response to Flaviviruses (arboviruses group B), including Dengue viruses, as well as in detecting and/or diagnosing the presence of antibodies against the bengue virus serotypes in a sample and for gene therapy. The current sequence is that of the Dengue virus C15/prM/E antigen fusion protein of the invention which comprises 15 amino acids of the capsid (C) protein fused to the full-length prM protein and envelope (E) protein.
The invention relates to a novel recombinant or synthetic polypeptide comprising an amino acid sequence that has at least about 90% sequence identity to any of the 20 fully defined amino acid sequences given in the specification. The polypeptide of the invention demonstrates virucide activity and may be useful for inducing an immune response to Flaviviruses (arboviruses group B), including Dengue viruses, as well as in detecting and/or diagnosing the presence of antibodies against the Dengue virus serotypes in a sample and for gene therapy. The current sequence is that of the Dengue virus type 1 (DEN-4)/unidentified Dengue the invention which comprises 15 amino acids of the DEN-4 capsid (C) protein fused to the full-length DEN-4 codon-optimised/unidentified Dengue virus prup protein and DEN-4 codon-optimised/unidentified Dengue virus prup protein and DEN-4 codon-optimised/unidentified Dengue virus prup protein and DEN-4 codon-optimised/unidentified Dengue virus prup protein and DEN-4 codon-optimised/unidentified Dengue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New recombinant or synthetic polypeptides and polynucleotides useful for diagnosing, preventing or treating diseases associated with flaviviruses, including dengue viruses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                virucide; Flavivirus; arboviruses group B; gene therapy; C15/prM/E; prM;

The invention relates to a novel recombinant or synthetic polypeptide comprising an amino acid sequence that has at least about 90% sequence identity to any of the 20 fully defined amino acid sequences given in the specification. The polypeptide of the invention demonstrates virucide activity and may be useful for inducing an immune response to Plaviviruses (arboviruses group B) including Dengue viruses, as well as in detecting and/or diagnosing the presence of antibodies against the sequence is that of the Dengue virus type 4 (DEN-4) Den-4CIS/prw/F antigen fusion protein of the invention which comprises 15 amino acids of the capsid (C) protein fused to the full-length prM protein and envelope
                                                                                                                                                                                                                              New recombinant or synthetic polypeptides and polynucleotides useful for diagnosing, preventing or treating diseases associated with flaviviruses, including dengue viruses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         virucide; Flavivirus; arboviruses group B; gene therapy; C15/prM/E; prM;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a novel recombinant or synthetic polypeptide comprising an amino acid sequence that has at least about 90% sequence identity to any of the 20 fully defined amino acid sequences given in the specification. The polypeptide of the invention demonstrates virucide activity and may be useful for inducing an immune response to Flaviviruses (azboviruses group B), including Dengue viruses, as well as in detecting and/or diagnosing the presence of antibodies against the bengue virus serotypes in a sample and for gene therapy. The current sequence is that of the Dengue virus CIS/prw/E antigen fusion protein of the invention which comprises 15 amino acids of the capsid (C) protein fused to the full-length prw protein and envelope (E) protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New recombinant or synthetic polypeptides and polynucleotides useful for diagnosing, preventing or treating diseases associated with flaviviruses, including dengue viruses.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a novel recombinant or synthetic polypeptide comprising an amino acid sequence that has at least about 90% sequence identity to any of the 20 fully defined amino acid sequences given in the specification. The polypeptide of the invention demonstrates virucide activity and may be useful for inducing an immune response to Plaviviruses (arboviruses group B), including Dengue viruses, as well as in detecting and/or diagnosing the presence of antibodies against the Dengue virus serotypes in a sample and for gene therapy. The current sequence is that of the Dengue virus C15/prM/E antigen fusion protein of
                                                                                     The invention relates to a novel recombinant or synthetic polypeptide comprising an amino acid sequence that has at least about 90% sequence identity to any of the 20 fully defined amino acid sequences given in the specification. The polypeptide of the invention demonstrates virucide activity and may be useful for inducing an immune response to Plaviviruses (arboviruses group B), including Dengue viruses, as well as in detecting and/or diagnosing the presence of antibodies against the Dengue virus serotypes in a sample and for gene therapy. The current the invention which comprises 15 amino acids of the capsid (c) protein of the invention which comprises 15 amino acids of the capsid (c) protein fused to the full-length prM protein and envelope (E) protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New recombinant or synthetic polypeptides and polynucleotides useful for diagnosing, preventing or treating diseases associated with flaviviruses, including dengue viruses.
diagnosing, preventing or treating diseases associated with flaviviruses, including dengue viruses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          virucide; Flavivirus; arboviruses group B; gene therapy; C15/prM/E; prM;

The polypeptide of the invention demonstrates virucide activity and may be useful for inducing an immune response to Flaviviruses (arboviruses group B), including Dengue viruses, as well as in detecting and/or diagnosing the presence of antibodies against the Dengue virus serotypes in a sample and for gene therapy. The current sequence is that of the Dengue virus C15/prM/B antigen fusion protein fuse invention which comprises 15 amino acids of the capsid (C) protein fused to the full-length prM protein and envelope (E) protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New recombinant or synthetic polypeptides and polynucleotides useful for diagnosing, preventing or treating diseases associated with flaviviruses, including dengue viruses.
                                                                                                                                                                                                                                                                                                                                                                         virucide; Flavivirus; arboviruses group B; gene therapy; C15/prM/E; prM;
the invention which comprises 15 amino acids of the capsid (C) protein fused to the full-length prM protein and envelope (E) protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

This sequence represents the amino acid sequence of one of the candidiate vaccine viruses of the invention. This sequence is based on a fragment of the polyproctein from Dengue 2 virus, strain 16681. The polyproctein from Dengue 2 virus, strain 16681. The polyproctein comprises the capsid, prw, M. E. NS1, NS2A, NS2B, NS3, NS4A, NS4B and NS5 proteins. The quadravalent vaccine of the invention comprises an attenuated Dengue virus clone, PDK-53, and a chimeric DEN-2/1 virus, a chimeric DEN-2/3 virus, and/Or a chimeric DEN-2/4 virus. The new quadravalent vaccines are used to protect against infection by all four serotypes of dengue virus, DEN-1, DEN-2, DEN-3 and DEN-4, which can lead to dengue fever or fatal dengue haemorrhagic fever/dengue shock syndrome (DHF/DSS). Host cells are used to produce the recombinant protein products of the DNA constructs which are used in the vaccines. (Updated on 27-AUG-2003 to correct OS field.)

The invention relates to avirulent, immunogenic flavivirus chimeras comprising amino acid mutations in the non-structural proteins of a flavivirus. Chimeric viruses containing the attenuation-mutated non-structural genes of the virus are used as a backbone into which the structural genes of the virus are used as a backbone into which the structural protein genes of a second flavivirus strain are inserted. These chimeric viruses elicit pronounced immunogenicity but lack the accompanying clinical symptoms of viral disease. Attenuated chimeric flaviviruses are combined in a pharmaceutical composition to confer simultaneous immunity against several strains of pathogenic flaviviruses such as dengue virus serotypes DEN-1, DEN-2, DEN-3 and DEN-4. Immunogenic flavivirus chimeras are also used as immunogens or multivalent vaccines to confer simultaneous protection against infections. The present sequence is wild-type, virulent dengue-4 (DEN-4) 1036 virus protein used for constructing flavivirus chimeras. Dengue virus types 1-4 (DEN-1 to DEN-4) are mosquito-borne flavivirus pathogens. The flavivirus protein contains a capsid protein (E) and non-structural proteins (NSI-NS2A-NS3-NS4A-NS3-NS4B-NS5). (Updated on 11-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ä

The present invention relates to novel mutated flaviviruses comprising a phenotype in which the viral genome is modified by introduction of a mutation, singly or in combination, taken from mutations from recombinant virus bearing Vero adaptation mutations, putative Vero cell adaptation mutations of dengue type 4 virus (DEN4) or mutations known to attenuate useful for fine tuning the attenuation and growth characteristics of dengue virus vaccines for the prevention and youth characteristics of infection. The present sequence is Dengue virus type 4 strain rDEN4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New mutated flavivirus, useful for fine tuning the attenuation and characteristics of dengue virus vaccines for the prevention and/or treatment of dengue virus infection.
                                                                                                                                                                                                                                                                                                                                                                                                        Attenuation; growth; vaccine; infection; Dengue virus type 4.
                                                                                                                                                                                                                                                                                                                                                                Recombinant dengue virus type 4 strain rDEN4 protein.

                                                                                        ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to avirulent, immunogenic flavivirus chimeras comprising amino acid mutations in the non-structural proteins of a flavivirus. Chimeric viruses containing the attenuation-mutated nonstructural genes of the virus are used as a backbone into which the structural protein genes of a second flavivirus strain are inserted. These chimeric viruses elicit pronounced immunogenicity but lack the accompanying clinical symptoms of viral disease. Attenuated chimeric flaviviruses are combined in a pharmaceutical composition to confer simultaneous immunity against several strains of pathogenic flaviviruses is and natural aserotypes DEN-1, DEN-2, DEN-3 and DEN-4. Immunogenic flavivirus chimeras are also used as immunogens or multivalent vaccines to confer simultaneous protection against infections. The present constructing flavivirus chimeras. Dengue virus types 1-4 (DEN-1 to DEN-4) are mosquito-borne flavivirus pathogens. The flavivirus protein contains a capsid protein (C), premembrane/membrane protein (prM), an envelope protein (E) and non-structural proteins (BDK) cells 48 chimes is designated as DEN-4 burse.
                                                                                                                                                                                         Flavivirus, Dengue virus-4; DEN-4; vaccine; infection; virucidal; mutein; avirulent; immunogenic; viral disease; pharmaceutical; mutant; variant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Chimeric flaviviruses that are avirulent and immunogenic, useful for vaccinating against a range of dengue viruses.

The invention relates to avirulent, immunogenic flavivirus chimeras comprising amino acid mutations in the non-structural proteins of a flavivirus. Chimeric viruses containing the attenuation-mutated non-structural genes of the virus are used as a backbone into which the structural genes of the virus are used as a backbone into which the structural protein genes of a second flavivirus strain are inserted. These chimeric viruses elicit pronounced immunogenicity but lack the accompanying clinical symptoms of viral disease. Attenuated chimeric flaviviruses are combined in a pharmaceutical composition to confer simultaneous immunity against several strains of pathogenic flaviviruses such as dengue virus serctypes DEN-1, DEN-2, DEN-3 and DEN-4. Immunogenic flavivirus chimeras are also used as immunogens or multivalent vaccines to confer simultaneous protection against infections. The present sequence is dengue virus (DEN)-2/4-VP1 fusion protein related to the inventor in this fusion protein contains attenuated DEN-2 DEN-53V backbone comprising a valine at the non-structural protein (N3)-250 and the premembrane/membrane protein (PM) and an envelope protein (E) from wildtype DEN-4 1036 virus. (Updated on 11-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gene therapy; protein purification; virucide; cytostatic; vaccine; hemorrhage; bleeding; infection; flavivirus infection; neoplasm; cancer;
                                                                                                                                                                                                                                            Chimeric flaviviruses that are avirulent and immunogenic, useful for vaccinating against a range of dengue viruses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          DB 4; Length 3391; 76;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to novel mutated flaviviruses comprising a phenotype in which the viral genome is modified by introduction of a mutation, singly or in combination, taken from mutations from recombinant virus bearing Vero adaptation mutations, putative Vero cell adaptation mutations of dengue type 4 virus (DEN4) or mutations known to attenuate dengue type 4 virus. The methods and compositions of the invention are useful for fine tuning the attenuation and growth characteristics of dengue virus vaccines for the prevention and/or treatment of dengue virus infection. The present sequence is Dengue virus type 4 strain 2A protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New mutated flavivirus, useful for fine tuning the attenuation and growth characteristics of dengue virus vaccines for the prevention and/or treatment of dengue virus infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Flavivirus, Dengue virus, DEN; vaccine, infection, virucidal, avirulent, immunogenic, viral disease, pharmaceutical, fusion protein.

sific febrile illnesses to severe hemorrhagic manifestations or
                                                             and purified ApoptoM peptide comprises 9 amino acids, useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to an isolated and purified ApoptoM peptide. The invention is useful as a vaccine for the prevention and treatment of pathological conditions from non-specific febrile illnesses to severe hemorrhagic manifestations, encephalitic syndromes and these pathological conditions are linked to Plavivirus infection or cancers. The invention is also useful in gene therapy. The present sequence is a M1-40/YF (yellow fever).17D protein.
                                                                                        preventing or treating pathological conditions from non-
illnesses to severe hemorrhagic manifestations or
                                                                                                                                                                                                                                                                           The present invention relates to an isolated and purified ApoptoM peptide. The invention is useful as a vaccine for the prevention and treatment of pathological conditions from non-specific febrile illnesses to severe hemorrhagic manifestations, encophalitic syndromes and these pathological conditions are linked to Plavivirus infection or cancers. The invention is also useful in gene therapy. The present sequence is a M1-40/DEN (dengue)-2 (F36) mutant protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gene therapy, protein purification; virucide; cytostatic; vaccine; hemorrhage; bleeding; infection; flavivirus infection; neoplasm; cancer;

The invention is useful as a vaccine for the prevention and treatment of pathological conditions from non-specific febrile illnesses to severe hemorrhagic manifestations, encephalitic syndromes and these pathological conditions are linked to Flavivirus infection or cancers. The invention is also useful in gene therapy. The present sequence is a p(95-114) EGFP (enhanced green fluorescent protein) (MI-M40)DEN (dengue) - (136F) plasmid DNA encoded protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated and purified ApoptoM peptide comprises 9 amino acids, useful as a vaccine for preventing or treating pathological conditions from nonspecific febrile illnesses to severe hemorrhagic manifestations or
                                                                                                                                                                                                                                              Gene therapy; protein purification; virucide; cytostatic; vaccine; hemorrhage; bleeding; infection; flavivirus infection; neoplasm; cancer; DEN; dengue; EGFP; enhanced green fluorescent protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a method for producing flavivirus-like particles (1) ex vivo, by providing nucleic acids comprising packaging competent retroviral-derived genome, cDNA encoding core proteins from retrovirus, and cDNA encoding a polyprotein comprising flavivirus core protein and flavivirus prhy protein and/or a flavivirus E envelope protein and flavivirus prhy protein and/or a flavivirus E envelope core proteins (ADR8171A). TADR87182). The packaging competent retroviral-derived genome and core proteins are form a retrovirus chosen from murine leukaemia virus (MLW), ALV, respiratory syncytial virus (RSV), MPWV, HIV-cepiratory syncytial virus (RSV), MPWV, HIV-cepiratory syncytial virus (RSV), MPWV, HIV-cepiratory syncytial virus (RSV), MPWV, HIV-cepiratory syncytial virus (RSV), MPWV, HIV-cepiratory syncytial virus (RSV), MPWV, HIV-cepiratory syncytial virus (RSV), MPWV, HIV-cepiratory syncytial virus (RSV), MPWV, HIV-cepiratory core protein and a native flavivirus prM and/or E protein and a native flavivirus prm and/or E protein and a native flavivirus prm and seame flavivirus. The mucleic acid sequence comprising a packaging competent retroviral-derived genome further comprises a transgene. (I) are useful for ex vivo identification of a receptor for flavivirus prm and/or E syloprotein; for ex vivo screening or identification of a receptor for flavivirus prm and core for generated by assembling full-length, unmodified prm and a vector for generated by assembling full-length, unmodified prm and E glycoproteins onto retroviral core proteins derived from murine leukaemia condens from west Nile Virus was generated by inserting a blunt-ended fragment encoding the last 22 residues of flavivirus core (C) and all of prM and E proteins into the BamHI digested and Klenow blunted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Producing flavivirus-like particles for use as a vaccine, comprises transfecting cells with cDNA encoding flavivirus prM and/or E protein, and expressing and allowing structural proteins to form virus-like particles.
                                                                                                                                                                                                                             Virucide; Vaccine; Gene therapy; flavivirus; flavivirus core protein; flavivirus prM protein; flavivirus E protein; envelope glycoprotein;
                                                                                                                                                                                                                                                                                                                                                                                                                                                   (INRM ) INSERM INST NAT SANTE & RECH MEDICALE.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel isolated nucleic acid useful as vaccine for preventing flavivirus infection, comprises transcriptional unit encoding signal sequence of one flavivirus and immunogenic flavivirus antigen of a second flavivirus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a novel nucleic acid comprising a transcriptional unit encoding a signal sequence of a structural protein of a first flavivirus and an immunogenic flavivirus antigen of a second flavivirus, where the transcriptional unit directs the synthesis of the antigen. The polynucleotide of the invention has virucide activity, and acts as a vaccine. A composition of the invention is useful for immunishing a subject against infection by a flavivirus. The polynucleotide is useful as a vaccine for preventing flavivirus infection. The sequence represents plasmid pCBYF, which contains yellow fever virus prM and E proteins
vector phCMV-G. The present sequence is Yellow Fever Virus deltaCprME protein comprising successively a carboxy terminus of flavivirus core protein, and flavivirus prM and flavivirus E proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Flavivirus; immunogenic flavivirus antigen; virucide; vaccine; prM-E;
                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a novel nucleic acid comprising a transcriptional unit encoding a signal sequence of a structural protein of a first flavivirus antispen of a second flavivirus antispen of a second flavivirus, where the transcriptional unit directs the synthesis of the antigen. The polynucleotide of the invention has virucide activity, and steps as a vaccine. A composition of the invention is useful for immunising a subject against infection by a flavivirus. The polynucleotide is useful as a vaccine for preventing flavivirus infection. The sequence represents plasmid polspow, which contains Powassan virus prw and E encoding proteins. Note: The protein sequence is not encoded by the CNNA sequence given in ABV77538, which is quoted as the encoding polynucleotide in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                        Novel isolated nucleic acid useful as vaccine for preventing flavivirus infection, comprises transcriptional unit encoding signal sequence of one flavivirus and immunogenic flavivirus antigen of a second flavivirus.

The present sequence is that of an Asibi/hamster passage 7 yellow fever virus polyprotein. Comparison of this sequence with that of an Asibi/hamster passage 0 virus revealed 7 amino acid substitutions: in the envelope protein, His replaces Gln-27, Gly replaces Asp-28, Ala replaces Hap-155, Arg replaces Thr-48; and hrg replaces Lys-31; in the NG2A protein, Ala replaces Thr-48; and in the NS4B protein, Ile replaces Val-98. A claimed isolated mucleic acid encodes a yellow fever virus with a viral genome that comprises an altered mucleic acid sequence resulting in at least 1, and optionally up to all 7, of these amino acid substitutions. The virus is used in a vaccine composition. The methods and compositions of the invention provide for improvement of the reversion frequency of an attended yellow fever virus for use in safer vaccines in which the risk of disease is reduced or eliminated.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated nucleic acid encoding a Yellow Fever virus and having alterations of at least two nucleotides, useful in the fields of molecular biology and virology, particularly for producing an improved
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          WNV; PrM protein; E protein; polyprotein; envelope; membrane; vaccine.

                                                                                                                              Isolated immunogenic composition useful for immunizing animal against whest Nile Virus WNV, comprises single or complex of WNV PrM/E heterodimer consisting of recombinant WNV PrM polypeptide and recombinant WNV E polypeptide.
                                                                                                                                                                                                 The specification describes an immunogenic composition which comprises a complex of West Nile Virus (WNV) PrM/B heterodimer or a single WNV PrM/E heterodimer or a single WNV PrM/E heterodimer consisting of a recombinant WNV PrM Polypeptide and a recombinant WNV B polypeptide. The immunogenic composition of the invention is useful for immunizing an animal against the WNV. It is also seguence represents a WNV antibodies in a biological sample. The present sequence represents a WNV PrM region. The WNV polyprotean is proteolytically processed by the viral serine protease NS2B-NS3 and various callular proteases into 10 mature viral proteins, in the order: NS2A-NS2B-NS3-NS4A-NS4B-NS5.

Isolated immunogenic composition useful for immunizing animal against West Nile Virus WNV, comprises single or complex of WNV PrM/E heterodimer consisting of recombinant WNV PrM polypeptide and recombinant WNV E
                                                                                                                                                                                                                      The specification describes an immunogenic composition which comprises a complex of West Nile Virus (WNV) PrM/E heterodimer or a single WNV PrM/E heterodimer or a single WNV PrM/E heterodimer consisting of a recombinant WNV PrM polypeptide and a recombinant WNV E polypeptide. The immunogenic composition of the invention is useful for immunisting an animal against the WNV. It is also useful for detecting WNV antibodies in a biological sample. The present sequence represents a synthetic PrM/E region of WNV. The WNV polyprotein is proteolytically processed by the viral serine processe NS2B-NS3 and various cellular processes into 10 mature viral proteins, in the order:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This sequence represents the heterodimer glycoprotein, PreM-E, from West-
Nile virus. This protein was used as an antigen to raise a purified
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New purified polypeptide derived from a West-Nile or Dengue virus antigen, useful in preparing a vaccine for diagnosing, treating and/or preventing West-Nile or Dengue viral infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          secreted envelope protein; heterodimer glycoprotein; PreM-E; NS-1 protein; West-Nile virus; measles virus; vaccine; Dengue virus;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel isolated nucleic acid useful as vaccine for preventing flavivirus infection, comprises transcriptional unit encoding signal sequence of one flavivirus and immunogenic flavivirus antigen of a second flavivirus.
polyclonal or monoclonal antibody. The cDNA encoding this protein may be used in the generation of a measles virus which may be used in a pharmaceutical composition, or in the production of a recombinant virus for the preparation of an anti-West-Nile virus vaccine or an anti-Dengue virus vaccine. The polynuclectide sequences of the invention are useful for detecting the presence or absence of a West-Nile or Dengue virus antigen in a biological sample. The pharmaceutical composition is an anti-West-Nile or Dengue virus agent in the preparation of an anti-West-Nile or Dengue virus vaccine. They can also be used in diagnosing and preventing West-Nile or Dengue viral infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a novel nucleic acid comprising a transcriptional unit encoding a signal sequence of a structural protein of a first flavivirus and an immunogenic flavivirus antigen of a second flavivirus, where the transcriptional unit directs the synthesis of the antigen. The polynucleotide of the invention has virucide activity, and acts as a vaccine. A composition of the invention is useful for immunishing a subject against infection by a flavivirus. The polynucleotide is useful as a vaccine for preventing flavivirus infection. The sequence represents plasmid pCBWN, which contains West nile virus prM and E proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Flavivirus; immunogenic flavivirus antigen; virucide; vaccine; prM-E_j pCBWN; West nile virus.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a novel nucleic acid comprising a transcriptional unit encoding a signal sequence of a structural protein of a first flavivirus and an immunogenic flavivirus antigen of a second flavivirus, where the transcriptional unit directs the synthesis of the antigen. The polynucleotide of the invention has virucide activity, and acts as a vaccine. A composition of the invention is useful for immunising a subject against infection by a flavivirus. The polynucleotide is useful as a vaccine for preventing flavivirus infection. The sequence represents plasmid pcBJESS-M, which contains St. Louis encephalitis virus prM and B proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

F;156,269,442,602,919,964,996,1189/Binding site: carbohydrate (Asn) (covalent) #status pr
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           genome polyprotein - yellow fever virus (strain 17D)

N;Contains: capsid protein C; envelope protein M; major envelope protein E; nonstructural protein NS44; nonstructural protein NS44; nonstructural protein NS5
C;Species: yellow fever virus
C;Species: yellow fever virus
C;Accession 1. Nov-1985 #sequence_revision 27-Nov-1985 #text_change 31-Dec-2004
C;Accession M; Yorker
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  RiRice, C.M.; Lenches, B.M.; Eddy, S.R.; Shin, S.J.; Sheets, R.L.; Strauss, J.H. Doctulinum neurotoxin type B hemagglutinin component, 33K - Clostridium botulinum (strain N;Alternate names: protein HA-33
C;Species: Clostridium botulinum
A;Variety: strain Eklund 17B
C;Accession: S58857
K;Accession: S58857
A;Title: Cloning and sequencing of a hemagglutinin component of the botulinum neurotoxin A;Reference number: S58855
A;Molecule type: DNA
A;Residues: 1-292 < EAS>A;Accession: S5885
A;Cossion: S5885

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      genome polyprotein - dengue virus type 2 (strain TH-36) (fragment)
N;Contains: envelope protein E; membrane-associated protein M; nonstructural protein NS1
C;Species: dengue virus type 2
C;Species: dengue virus type 2
C;Date: 30-Sep-1993 #sequence_revision 30-Sep-1993 #text_change 31-Dec-2004
C;Accession: JQ1404

GNORTHINS: Capsid protein C; envelope protein B; membrane-associated protein MS5

UNCONTENTS: Capsid protein C; envelope protein B; membrane-associated protein NS5

C; Species: dengue virus type 2

C; Detein NS43, nonstructural protein NS4b; nonstructural protein NS5

C; Detein NS4251; M343496; M3753

C; Decession: A42451; A43496; A43763

N;Contains: capsid protein; envelope protein; membrane protein; nonstructural protein NS¹
a; nonstructural protein NS4b; nonstructural protein NS5
C;Spacies: Japanese encephalitis virus
C;Date: 30-Jun-1992 #sequence_revision 30-Jun-1992 #text_change 31-Dec-2004
C;Accession: A35519
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              RiNtayaphan, S.; Grant, J.A.; Chang, G.J.J.; Trent, D.W.

01-NOV-1996, integrated into UniProtKB/TrEMBL.
01-NOV-1996, sequence version 1.
07-FEB-2006, entry version 26.
Polyprotein (Fragment).
Dengue virus type 4.
Viruses; ssRNA positive-strand viruses, no DNA stage; Flaviviridae;
Flavivirus; Dengue virus group.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
